1. INTRODUCTION

The purpose of this document is to provide guidance for Technology (TEC) in the framework of organising a FISU University World Cups & World University Championship hereinafter it will be referred to as the event.

The Organising Committee (OC) is obliged to follow the given set of guidelines and requirements in every segment covered in this document in order to increase consistency and for the success of the delivery of the event.

As after each season, there are new lessons learned and guidelines can be improved, and the FISU ICT department retains the right to adapt the TEC Guidelines on an annual basis.

2. MAJOR UPDATES

This chapter lists the major changes/updates in this version in relation to the previous one.

Chapter	Change
GMS	Updated following the introduction of the FISU GMS
Information Security	New chapter

3. TERMINLOGY AND ABBREVIATIONS

3.1. *Terminology*

For the purposes of this document, the following terms are to be understood as follows:

- Must / Shall / Are to — used interchangeably to indicate an obligation or mandatory requirement for the Organising Committee and other responsible parties.
- Should — expresses advice or a strong recommendation. While not mandatory, following these points is highly encouraged for best practice and successful delivery.
- May / Can — indicates permission or optional actions that the Organising Committee or relevant stakeholders are allowed to undertake

3.2. *Abbreviations*

ACR – Accreditation
FA – Functional Area (Department)
FISU – International University Sports Federation
FOP – Field-of-play
GMS – Global Management System
HB – Host Broadcaster
HoD – Head of Delegation
HVAC – Heating, Ventilation, and Air Conditioning
IBC – International Broadcasting Centre
IBU – International Biathlon Union
ICT – Information & Communication Technology
IF – International Sports Federation
IS – Information System
LAN – Local Area Network
MAN – Metropolitan Area Network
OC – Organising Committee
OVR – On Venue Results
RS – Results Systems
RTS – Results
SEQ – Sport Entries
TEC – Technology
TSR– Timing & Scoring
TVG – TV Graphics
WAN – Wide Area Network

4. GENERAL OVERVIEW OF TECHNOLOGY REQUIREMENTS

4.1. *Responsibilities of the TEC FA*

The main responsibilities of the TEC FA include the specifications preparation as well as the selection, implementation, testing, operation and support of all technology solutions and systems required for the event, as required by the attribution contract.

The above includes the provision of IT applications, network services, audio-visual technology, scoreboard technology and the selection and management of relationships with various technology providers (Results Systems, telecommunication companies, etc.).

The provision of the following systems, equipment and/or services falls under the responsibility of the TEC FA (either directly or through the selection of providers): Infrastructure Management, Hardware & Software Management, Event Management System, Results Systems, and System Integration Management.

Due to the large amount of personal data that an OC will process throughout an event lifecycle, an appropriate information security management system shall be developed (or adopted) to ensure that all information is protected against the risk of loss, misuse, disclosure or damage.

4.2. *Responsibilities of FISU TEC*

FISU has a role to assure, assist and oversee the OC in the preparations:

- Define the Technology Guidelines
- Provide support and guidance through the entire journey
- Provide specific technology solutions through FISU Technology Partners
- Manage the Transfer of Knowledge process between OC's

4.3. *Initial survey & technology budget planning*

Technology is an essential part of the event operations and planning processes and may have a substantial impact on the budget of the event. Therefore, the following aspects should be carefully considered when planning the budget:

- Infrastructure, Hardware & Software
- Connectivity & Network
- Global Management System
- Results Systems
- Information Systems

In planning the costs related to the above-mentioned items it is important to:

- Perform a survey of the existing status in order to determine the scope and amount of work necessary.
- Perform a survey of the current connectivity network status (WAN/MAN/LAN), taking note of the status of the existing fibre, its quality and the bandwidth, as well as any potential upgrades to be done. Ensure enough time to implement any changes/upgrades, as this is crucial for accommodating the needs of all the users during the event. Special attention shall be paid regarding the "heavy" users such as TV for transmission of signals, compressed and/or uncompressed.

- Include the requirements and needs of all the functional areas of the Organising Committee as well as all other relevant client groups in the initial and detailed budget planning. This point is particularly important concerning the definition of the type and number of equipment such as computers, laptops, printers, phones, etc.
- Take into account the potential integration cost that may arise when systems of several different providers are being implemented.

Ideally, this survey and budget planning should be done during the bidding phase as it will help the future Organising Committee significantly in having a better insight into the work and expenditures that might be incurred by the preparation and delivery of the event.

4.3.1. Workforce

There are many aspects that need to be taken into account when planning the workforce for an event. When it comes to the recruitment of staff and volunteers the OC needs to plan ahead taking into account the time necessary to train the volunteers and staff where applicable. The number of staff changes throughout the event lifecycle and is likely to increase from the event attribution until the actual delivery of the event. OCs normally start with a very basic staff structure and a very small total number of employees.

The further development of the TEC Functional Area (FA) staff depends on several factors, such as an increase of the overall number of employees in the OC and the number of venues used for the event (sport and non-sport venues).

4.4. *Selection of partners & providers*

In order to minimise the costs, it is of paramount importance to select reliable TEC partners and providers at an early stage of the event planning. OCs are highly recommended to seek partnership/sponsorship contracts with the various provider(s).

When selecting the providers for Results Systems it should be taken into account that these systems must be provided as an integrated system by one Vendor, recognised and approved (in some cases it is necessary that it is also certified) by the relevant International Federation (IF) and FISU.

In order to ensure that the FISU Guidelines regarding Technology and Marketing are followed, the OC is required to include FISU in the process of defining the specifications for selecting providers and the Results Systems providers.

As FISU continues to expand its pool of Technology Partners, it is strongly recommended that the Organising Committee contact the FISU ICT department to discuss the technical solutions available through FISU.

➔ ***Email: ict@fisu.net***

5. INFRASTRUCTURE MANAGEMENT

The infrastructure management refers to the management of IT network infrastructure – Metropolitan Area Network – MAN, Wide Area Network – WAN, Local Area Network – LAN (network in venues), system cabling as well as related hardware.

All hardware, network and software specific information provided in this document are basic guidelines, based on the experience at previous event. It must be understood that all the requirements may and will vary depending on:

- Physical distance of venues
- Software platform
- Software architecture
- Number of sports
- Number of sports that will be broadcasted live, etc.

5.1. *Hardware*

For the smooth running of the event various kinds of ICT equipment must be provided, including, but not limited to the following:

- PC working stations
- Notebook computers
- Tablets and other mobile devices
- Monitors
- Printers
- Scanners
- Entire network equipment not included within WAN infrastructure
- Video conference equipment
- Copy machines
- Mobile phones (smartphones with SIM cards and data connection)

The OC's TEC FA is obliged to ensure that the selected hardware has an adequate quality and guarantee adequate quantities for the needs of the entire event.

Also, a certain amount of spare parts is required in case of malfunction. In order to determine the required amount of spare equipment, the OC should make a detailed analysis of equipment usage, taking into account the need of high availability of certain services and applications.

When purchasing IT equipment, standardisation should be taken into account in order to minimise potential differences in configurations and types of equipment thus making the back-up equipment easier to procure.

In order to determine the full hardware demand for the event, the needs of all stakeholders and client groups should be taken into account from different points of view (multidimensional).

5.2. *Wide Area Network (WAN) / Metropolitan Area Network (MAN)*

Network connections between the venues (WAN/MAN network) have to be installed in accordance with the capacity needed for a fast and reliable transfer of data from dedicated venues to other physical locations. The level of capacity of both, LAN and MAN/WAN network, depends on the needs of the

different services that will be provided in and between the venues during the event. Requirements of all functional areas/systems need to be taken into consideration.

5.2.1. Network Redundancy

WAN/MAN network redundancy must be ensured, i.e. there has to be a redundant source of communication in place. It should serve as a backup mechanism for an automatic switch of network operations onto redundant infrastructure, in the event of a failure or abnormal termination of the network (network failover).

5.3. *Local Area Network (LAN)*

Setting up and maintaining a fully functional LAN in each of the key venues mentioned in the sections above is an important task of the TEC department. It is recommended to build LAN infrastructure in the venues at the time of the venue construction/renovation. This means that during the construction phase of a facility, attention must be placed on the LAN network infrastructure needs of all FAs with regards to the number of ports needed in their working areas, usage information to be able to determine the needed bandwidth, etc.

International standards for structured cabling (TIA/EIA, ISO/IEC) must be followed when designing LAN networks.

LAN infrastructure at the venues can also be wireless (Wi-Fi). This is particularly convenient for old venues without LAN infrastructure. In principle, wireless LAN networks are slower than wired networks. Wireless LAN infrastructure is used only for Internet access (i.e. for media seats and general public in the venues, Athletes' Village, hotels, etc.). Special consideration must be given to wireless security. For the purposes of the Results Systems, and other systems that crucial for the running of the event, only cable connections are acceptable due to reliability reasons.

In order to properly design the LAN in each venue, detailed requirements must be collected from all functional areas of the OC as well as any external provider (Results Systems, Host Broadcaster). This process should determine the particular needs.

For each office or facility where the OC staff and/or any of the other client groups use LAN infrastructure. The following points should be taken into consideration:

- Number of people working in each facility as well as an estimated number of visitors (FISU Family, delegations, Media, Results systems provider) that will use wireless in the venues (this will allow the OC to determine the number of necessary cable ports and/or Wi-Fi access points).
- Number of network printers/photocopy machines and/or other equipment that require cable ports and/or Wi-Fi access points.
- Type and number of other equipment that will be required in the venues (TV monitors, phones, etc.).

The most common type of Wi-Fi network is the 2.4 GHz network. Its main advantages are the accessibility from greater distances and the compatibility with many devices.

Its greatest disadvantage is a potential risk for interferences. Our recommendation is to use 5 GHz networks that use a wider frequency range (more bandwidth). They usually perform at a higher speed and have only little interference from other devices but cover shorter distances than the 2.4 GHz networks.

In addition to the information provided above, the OC is advised to take into account the following:

- Internet provided for the participants (delegations, FISU Family, Media, various providers, etc.) to be provided free of charge.
- Using different SSID for each key client group (e.g. OC staff, FISU Family, Media, general public, etc.) with dedicated bandwidth for each; enabled automatic sign- in in each new venue

after the initial registration on the network (to avoid interferences, we can use only one SSID with a radius server for the authentication and redirect the client groups to their dedicated network).

- FISU offices to be equipped with sufficient bandwidth that provide an adequate speed in order to ensure that the staff can operate smoothly (minimum requirement for the offices are 50-100 Mbps symmetrical upload/download connections).
- Ensure there is sufficient IP range available to support the number of people working in the FISU offices.
- FISU official hotel(s) must have sufficient capacities to ensure a smooth-running internet connection in all hotel rooms.
- The OC is advised to conclude the necessary agreements with the hotel in order to ensure the above.

6. GLOBAL MANAGEMENT SYSTEM (GMS)

The Global Management System (GMS) stands for a system comprised of several applications that should facilitate the work of the OC. The GMS should be based on a central database that is shared with all applications in order to ensure data consistency across the OC departments. The core GMS application groups together the modules linked to the overall Accreditation (ACR) process, while all other modules are considered optional and are used, or not, based on the needs of the OC. Here below is an overview of the modules that can be part of the GMS:

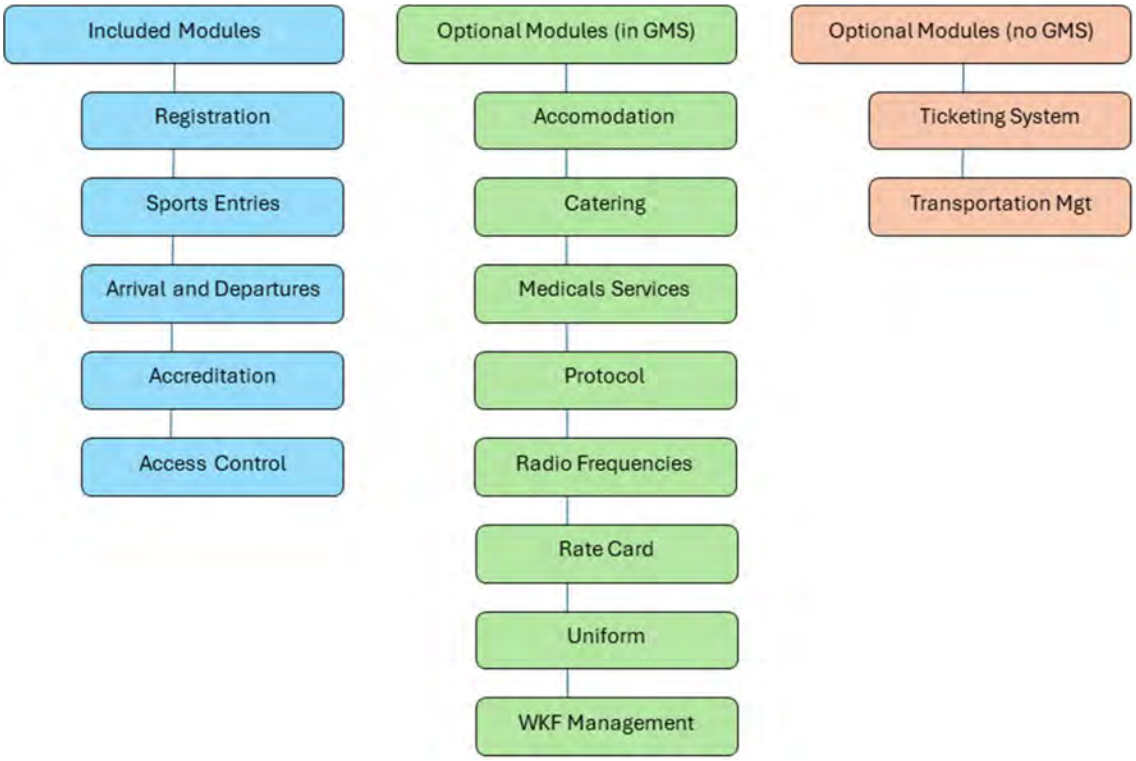

Figure 1 GMS Modules

All the OCs are receiving the FISU GMS free of charge to manage all the processes related to Accreditation for all client groups (see section 6.1 for the concerned modules). The online Accreditation process should be launched one year before the event. FISU will need to coordinate with the selected RTS provider regarding the "initial download" (transfer of information from FISU GMS to system of the Results provider). More information about Results can be found section 7.

The functionalities of the GMS modules are described in the text below. Please note that these guidelines are rather general and cannot be considered the finite or full description of business processes of the mentioned modules. They include the instructions on what are the FISU guidelines and the detailed specifications can be discussed between the OC and FISU based on the OC's specific procedures and needs.

It is up to the OC to decide whether it has the need to implement any of the optional modules.

6.1. *Accreditation Process Modules*

The accreditation process includes the following modules: registration (REG), sport entries (SEQ), accreditation (ACR), Arrival & Departure (AND) and access control (ACC).

Online registration is the only way of registration for FISU events. Each OC will be given a presentation and training on how to use the FISU GMS. The configuration of the system for each event should start ideally one year before the opening of the registration for the event to ensure that all the event-specific information is captured, and any features added if required/possible.

For more details and decisions related to the procedures and definition of conditions for use of offline registration, please refer to the latest version of the FISU Accreditation Guidelines.

6.1.1. Registration

Module that allows management of all registered individuals and their related data, including personal information.

6.1.2. Sport Entries

Module that allows management the sport registration and qualification data of athletes and teams. It allows organisers to set quotas per discipline and event, and enables NUSFs to manage, review, and submit sport entries online.

6.1.3. Accreditation

The accreditation module allows management, generation, and printing of accreditation cards for all the participants, ensuring they have the necessary access rights and privileges. It involves validating participant information, creating badges, and controlling access to various event zones.

6.1.4. Arrival and Departure

This module should be used by the OC to control the arrival and departure dates of all the accredited persons for the event. This is critical to organise the transportation, meals, hotel rooms and the village accommodation.

Arrivals/Departure application should include accredited persons' list, arrival schedule, airport pickup planning and scheduling, hotel pickup planning and scheduling, etc.

6.1.5. Access Control

Web solution to control and monitor access to the different check points (venues, zones, etc.).

6.2. *Optional Modules*

Optional GMS modules include: Accommodation (ACM), Catering (CAT), Workforce (WKF), Rate card (RC), Uniforms (UNI) etc.

As mentioned before, the OC is free to decide there is necessity for implementing the optional modules that would serve to facilitate the work of the FAs. Please note that some of the processes can also be managed/supported by reports available from FISU GMS.

A very brief and basic description of the optional modules is given which should serve as a reference to the OC about the basic business processes that these modules should cover. Please note that the detailed business processes should be defined with the relevant FAs for each of the modules.

Lastly, the direct and indirect costs of integrating new modules are borne by the OC.

6.2.1. Accommodation Management

The Accommodation module streamlines the booking and management of lodging for participants, officials, and guests. It offers functionalities such as hosting management, booking system, room allocation, reservation tracking, reports, etc.

6.2.2. Catering

Module to manage meal bookings and allocate catering tickets for different organisations and people. The module proposes a Catering access control with the barcode/QR included in the accreditation card design.

6.2.3. Workforce Management

The workforce management module proposed in the GMS allows the management of volunteers and workforce, including registration via a public online portal, selection process, communication, assignment of tasks and schedules and shift management. The module proposed is linked with the accreditation process, so there would be no need for export data between the selection process and the accreditation process.

6.2.4. Rate Card

The mission of the Rate Card application is to provide (mainly to the delegations, sponsors, broadcasting stations, and the Media representatives) all information on and allow booking of equipment, services and necessary furniture that will be used before and during the event, given in lists containing items and respective prices.

6.2.5. Uniform Management

The Uniform Management module is used to keep track of uniform quantities calculation, sizes, models, etc. The module receives information from the registration forms about the participants of the event eligible to receive uniforms. This implies that during registration, the relevant client groups will also provide information about the size of various clothing items. This will allow the OC to calculate and purchase correctly the amounts, models and sizes based on these inputs. This will reduce the OC costs for purchasing of uniforms significantly, since the chance to make a mistake is reduced to minimum.

The uniform module manages the whole process of distributing the uniforms. The system keeps the inventory of all the uniforms during all the phases of storage and collection of uniforms.

6.2.6. Transportation Management

This is another very important application as it allows the OC to keep track of the different vehicles used during the event. However, normally, the city authorities might already have the solution that they are using for daily management of the public transportation in the city and it is highly recommended for the OC to discuss with the relevant authorities about the possibilities to use this existing application for the transportation management.

Currently, this module is not available in the GMS modules pool. In case of needs for such module, integration will be needed with the GMS.

7. RESULTS SYSTEMS

7.1. *General Requirements*

Results Systems are a crucial component of hosting a successful event, and, in principle, they comprise the following elements:

- Results System (RTS) – Timing & Scoring (TSR), data handling (OVR collects and processes all the information available within a venue), central results database (CRS).
- TV Graphics (TVG) – static or animated text and high-resolution animated graphics produced by a character generator for keying into a video stream.
- Information Systems – systems that show information of the central results system gathered in competition venue.
    - Web Results Page – enables all people around the world to access the results
    - Official website and competition related information

The implementation and operation of the Results Systems must be given to one vendor in order to reduce potential risks and functional failures during the process of creating a reliable unique data base and real time data representation on the website.

Furthermore, it is recommended that the selected provider must have experience with sport events of the sport in question and use up-to-date technology systems, as well as equipment approved (and where applicable, homologated and certified) by the relevant International Federation (IF). It is the obligation of the technology provider to adapt their system to the latest applicable IF regulations as well as information defined in the Technical Handbook of the sport (e.g. competition formats, applicable rules, etc.).

Various provisions must be made by the OC for the Results Systems provider to ensure that they can operate smoothly. These include, but are not limited to, the following:

- Cable connections between start and finish for both timing and audio.
- A main and backup infrastructure for the mentioned cables.
- Reliable and appropriate power source (with backup) as well as enough power outlets.
- Working space at the FOP (where required), an OVR room and storage room in each competition venue (details about the size to be agreed with the provider for each sport).
- Internet connections (cable and Wi-Fi) as indicated by the provider.
- Connection between the TVG and OB van (HB is usually in charge of this).
- Radios for internal communication within the venue.
- Well-trained staff and volunteers with English skills that are required in positions where sport-specific knowledge is necessary, e.g. statisticians, scoreboard operators, etc.
- Tables, chairs, HVAC in OVR rooms, etc.

Allocation of all the technology equipment in venues should be coordinated with TEC (and the providers related to their area of work).

As FISU continues to expand its pool of Technology Partners, it is strongly recommended that the Organising Committee contact the FISU ICT department to discuss the technical solutions available through FISU.

➔ ***Email: ict@fisu.net***

7.2. *Timing & Scoring*

The Timing & Scoring (TSR) is key to delivering a successful event. The main functions of this system (and its subsystems) are the generation of entry and start lists, draws, capturing scores, marks or times, ranking calculation and the delivery of information to various client groups.

The core requirements for the TSR are as follows:

- All applications should already be developed in accordance with the latest IF rules and properly tested (homologated/certified where required) in international events of appropriate level.
- The standard to be followed for all the printouts, scoreboard screens etc. is ORIS (Olympic Results & Information Services) unless otherwise specified by FISU.
- All subsystems of the TSR should be fully developed and integrated.
- The TSR system should be already tried and tested in events of World University Championship level or higher.
- The operators of TSR should have the necessary experience in the events of the level of the World University Championship or higher.

7.3. *TV Graphics*

FISU strongly recommends that the provision of TV graphics is in the scope of the Results Systems provider. If the OC decides to have TVG in the scope of Host Broadcaster, both onsite and remote tests between the HB and RTS provider must be planned for in terms of contracts and budget.

The style guides and templates for TVG are provided by FISU and are created for each event separately. FISU will include additional FISU-specific graphics in the templates, such as University name for each athlete. It is the OC's obligation to ensure that the selected Host Broadcaster including all the relevant TV directors are aware of this requirement and ready to implement it.

The main language of TVG for HB is English. Production of TVG in the local language of the OC or any other languages (Unilateral feeds) is subject to individual agreements for each event separately and may require provision of event graphics style customised for their own language. This should be discussed/agreed with the FISU Media & TV Production team.

Inclusion of sponsors' logos in TVG is one of its important aspects and is it should be noted that the owner of all marketing rights related to TVG is FISU. For any questions related to this matter, please contact the FISU Media & TV Production team.

7.4. *Information Systems*

Information Systems (Web Results Page and Event Website) are the most important applications used during the event. These are a set of systems used to provide the required information to each of the different client groups. This information has to be presented in a specific format that is a standardised presentation format. Each Information System has a specific update timing that is very important to consider and provide since they are important working tools as well as means through which clients obtain information. The system has to be able to cover all these needs.

They show the complete detailed schedule and results of sport events during the event. This schedule should also include Opening and Closing Ceremonies details (time, place, duration). It can also be used to show the schedule of non-sport events during the event.

Communication between these systems must be seamless in order to ensure the quality of data in OVR and avoid too many manual changes to the data in the OVR. Details on how information should be exchanged between these applications should be agreed with the Results Systems provider.

7.4.1. Web Results

The web page dealing with results is closely linked to the OVR System and these two systems must be compatible. To ensure compatibility, the Results Systems provider should be in charge of the whole process of results management and distribution in the Web Results page. Due to risks of not having a functional webpage, FISU does not accept OC proposals of developing their own results distribution system. There were several instances in the past World University Championship where the OCs insisted on developing their own Web Results Page that led to serious problems, e.g. late launch (after the event had already started). As this system provides information to all the people all over the world, it is of paramount importance that it is working perfectly.

The key requirements regarding Web Results Page:

- The language of the Web Results Page must be English. In case the OC wishes to provide these in any other language, there should be an interface provided to enter the translations into the system (multi-language support). The translation of the content would be the obligation of the OC.
- Results of the event should be shown live during the event in the websites of the OC, FISU and FISU partners. The provider of the results should provide the necessary instructions and data to ensure this. This can be done either via API or incorporating the iFrame provided by the Results Systems provider.
- Generation of the required dynamic HTML pages as well as all the required PDF reports so that they can be downloaded and printed easily.
- Must be available to the people all over the world with no difference in information shown in the host city and the rest of the world.
- Provider needs to ensure compatibility with all the major web browsers (Edge, Mozilla, Chrome, Safari, etc.) and to specify for which versions the website is optimised.

Following the event, Results must be provided to FISU for historical archiving purposes. The OC and the Results provider, as soon as it is known, must discuss with the FISU TEC team the format and manner in which the results will be transferred to FISU.

7.4.2. Event Website

FISU provides the OC with its own website, ensuring consistency throughout all the seasons.

First, the OC must fill in a form with specific information and photos and provide FISU with the identity of the person in charge of the website. Once this is sent, FISU's provider will populate the website with this minimum content and deliver it to the OC, who will be in charge of updating its content. The event website is its main link to the world, so it needs to showcase quality content.

In terms of access management, only individual accounts are accepted (not generic). Please contact the FISU ICT Department to request the creation of the accounts.

➔ ***Email: ict@fisu.net***

8. INFORMATION SECURITY

Online threats are becoming more common, so it's important to create clear rules to protect all the information used during the FISU World University Championships and Cups. These rules will help make sure the information stays private, accurate, and available when needed. They'll also include steps to prevent and respond to cyberattacks.

8.1. *Key principles*

The OC follows a set of key principles to keep information safe and secure:

- Make sure the information assets to be protected are known, as well as their level of sensitivity and identify those responsible;
- Identify information security measures based on the degree of sensitivity of information assets and the risks and threats that may affect their availability, integrity or confidentiality. These measures must cover the protection of assets, the detection of any abusive or inappropriate use, the eradication of threats and the recovery of potentially compromised OC activities;
- Ensure that the level of security measures to be deployed makes it possible to mitigate risks and maintain them at an acceptable level. The measures to be deployed must also take into account the level of maturity of the organization and be consistent in their application;
- Rigorously protect all data and ensure that computerized or non-computerized files containing their data are subject to appropriate control from the design/modification of information systems (Privacy by design & default);
- Clearly document expectations by providing all users with an evolving information security framework that describes all measures, standards, processes, procedures or guides dealing with this subject;
- Make all users aware of the risks and threats affecting information assets so that they understand the OC's expectations, can recognize incidents and potential risks, and develop the necessary skills;
- Protect the event against prolonged service interruptions by having a continuity plan in place to ensure the return to operation of services deemed essential in the event of a major disaster;

8.2. *Data Protection*

The laws governing the protection of individuals with regard to the processing of personal data is subject to be taken seriously.

FISU and the OC operate as separate data controller.

The creation of an internal Directive on the processing of personal data is critical. In the same way as for the different client groups and stakeholders, a Privacy Notice (external) must inform data subject about the processing of their data. However, it should be noted that when participants are registered in the FISU GMS, the FISU Privacy Notice applies.

To elaborate the internal Directive and the Notice, the following steps are recommended:

- Mapping of all the processing activities and for all FA's
- Description of all the processing activities and creation of a register of processing activities including the following information for each processing activity:
    - Description of the treatment
    - Actors
    - Purposes and sub-purposes / retention period / legal basis

    - DPIA
    - Data source
    - Categories of data
    - Sensitive data
    - Categories of data subjects
    - Recipients
    - Data transfer
    - Security measures
    - App/tools used for data processing
- Subcontractors mapping and analysis
- Review or draw up contracts with subcontractors processing personal data on behalf of the OC
- Create a register of applications using personal data
- Data subject rights management
- Data breach management

A Data Protection Officer (DPO) could be appointed to manage all aspects of data protection, whether corporate or event-related processing. The DPO can be internal or external.
